

→* Chapter → 1 *

→* Introduction to Programming *

⑧ Introduction of Computer System →

→ A Computer system is an electronic device that accept data or input process is according to instruction, store data and result process useful information as output.

⑧ Basic Components of Computer System →

→ A Computer system mainly consist of the following components like - input, processing, storage and output.

INPUT PROCESSING STORAGE OUTPUT

a) INPUT → Input unit is used to enter data and instruction into the computer
Keyboard, mouse, scanner, joystick etc.

⑧ C.P.U → It is a called the brain of computer. it perform calculation, process instructions and control other component.

The C.P.U mainly contain →

a) A.L.U → Arithmetic Logic Unit perform addition, subtraction, multiplication, Division, Logic operators such as AND, OR, NOT gate.

b) CU → Control units perform fetching instructions, decode instructions, control executing, co-ordinate different part of computer.

* Register → its are small high speed storage location inside the C.P.U used to temporary hold the data and instructions.

* Memory Unit → Memory store program data and intermediate final result.

a) Primary memory → RAM → are temporary and volatile memory.

ROM → Non volatile memory containing permanent instructions.

* Secondary Unit →

Secondary unit perform store data permanent

Hard disk, SSD card, pen drive, memory card etc

Date 28/09/26

⑧ Output Unit → It provide the process result to the user like monitor, printer, speaker, projector.

⑧ Software → Software is the collection of program and instruction that's tell what to do the computer.

→ Types of Software ←

- i) System Software
- ii) Operating Software
- iii) driver Software
- iv) Compiler Software
- v) Device Software

⑧ Application Software → It is used to user like ms word, Browser, media player.
